(a) cost relative to the optimum
KL spent / minimum KL $d_{\mathrm{Ber}}(\varepsilon\|p)$
10^1
10^0
10^{-1}
10^{-2}
target loop probability ε (reference $p = 0.69$)
(b) fixed budget: infeasibility
share of KL spent at infeasible nodes
share of node visits that are infeasible

10^{-1}
10^{-2}
target loop probability ε
fixed budget (re-solved each step)
fixed budget, always feasible
best history-independent budget schedule
fixed multiplier (exponential)
optimum (affine, one multiplier)
